Command Line Interface

The **Command Line Interface** (CLI), which is a collection of binaries running from Linux command line, was designed to perform basic tasks, suc as manage clients, zones, records. This area provides detailed information on how to use and integrate DNS Manager with third-party software applications.

Required Knowledge and Skills

Anyone with basic scripting and Linux/Unix administration skills should be able to use the **CLI** tools properly. System administrators or developers in need of tools for simple and fast administration of service providers, organizations, users, and extensions on a VoipNow server will be able to use these tools efficiently, simply by following the instructions in this manual.
