

Manage Outgoing Routing

About Outgoing Routing

VoipNow can route calls using selected channels based on time interval and destination. It can also perform predefined actions, such as block a call or route it through a particular channel or through the channel that provides the best cost for that destination. At the same time, it allows you to modify the destination's CallerID number when a particular channel is used.

To access all outgoing routing rules, click on the [Channels](#) link in the side menu and access the [Outgoing Routing Rules](#) icon in the **Assets** area. In this area, you will learn how to add and manage outgoing routing rules.
