

Service Provider's OpenID Identities

This page contains instructions on how to use OpenID identities on a service provider account.

- [Overview](#)
- [How to use OpenID identities](#)

Overview

The **OpenID Identities** page allows you to define new OpenID identities that a service provider can use to log in to their VoipNow account. The service provider account can only be linked to one of the existing OpenID providers.

The [OpenID identities](#) icon is only available if the OpenID is enabled infrastructure wide from the **Unified Communications Integrations OpenID Settings** page.

How to use OpenID identities

As system administrator(s), you may use these OpenIDs to connect to the service provider's account as well. If you want to use the same OpenID identity that is linked to your account to log in to the service provider's VoipNow account, you must define that identity here as well.

In case you want to log in to the service provider's account using your openidexample OpenID, you must link it to the service provider account as well. To do so, simply add openidexample as a new OpenID identity.

To read more on how you can configure a new OpenID identity, check [this section](#).
