

# Where can I find the VoipNow certificates

Applies to VoipNow 3.5!

Once you have upgraded to VoipNow 3.5, the web interface displays a certificate mismatch message.

## Step-by-step guide

It is assumed that you are using a CentOS 6.x, CentOS 7.x and you have latest version of VoipNow 3.5 installed.

Starting with VoipNow 3.5, the certificate path for all services has been changed to **/etc/voipnow/certs**. This means that, in case you need to modify the web interface certificate, you need to insert the proper certificate details in **/etc/voipnow/certs/http.pem**.

This folder also contains certificates for Kamailio and Asterisk. The Kamailio certificate is used in case TLS transport is selected on the phone, whereas the Asterisk certificate is used whenever SDES / SRTP - DTLS encryption is selected in **Provisioning and SIP**.
