

Managing IPs on templates

To access the **Template's IP Management** page, select the template from the list and then click the **Template IPs** button. The page that opens displays a list of template IPs and allows you to add new ones.

Here are the details displayed in the list of existing IPs:

- **Type:** The icon in this column shows the type of the IP address. It can be - **master** or - **allow transfer**. The type of the IP can be changed by pressing the icon in this column.
- **IP address:** The IP address.

If the list of IPs is too long, you can use the **Search** feature to find a specific IP. Write the search criteria in the text box and click the Search button. The system will display only the IPs that match the search criteria.

To display the entire list, press the **Show all** button.

To add an IP to the template:

1. Go to the **Add Template IPs** area and enter the IP in the corresponding fields:
 - **Add the following master IP:** For master IPs assigned to slave zones. Press the button to add multiple IPs.
 - **Add the following allow transfer IP or IP/Mask to master zones:** For allow transfer IPs assigned to master zones. Press the button to add multiple IPs.
2. When you're done, click **OK**. The IPs you've just entered will be added to the template.
